Social and Emotional Development in the Early Years

Information Sheet for
*Early Childhood Development
& Parent Support Providers*

This information sheet is intended for providers involved in early child care and learning, parenting education and/or family support, or any provider who has regular contact with families who have young children.

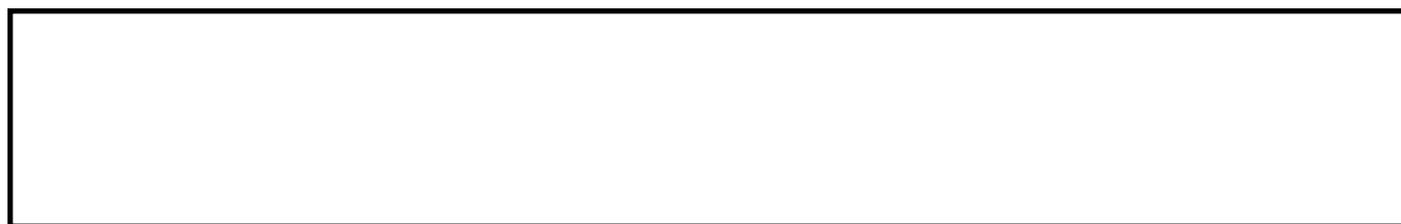

This information sheet was prepared for the BC Healthy Child Development Alliance by Evelyn Wotherspoon (www.evelynwotherspoon.ca), in partnership with the Public Health Agency of Canada (PHAC). The views expressed in this publication do not necessarily reflect the official views of the Public Health Agency of Canada.

We wish to acknowledge that the research findings used in this document were mainly drawn from the Harvard Center for the Developing Child Working Papers, available for download at http://developingchild.harvard.edu/resources/reports_and_working_papers/working_papers/

1 *Promoting the mental health of infants from birth to three*

A growing body of scientific evidence shows that the first three years of life are critically important for the long-term emotional health and development of a person.ⁱ This information sheet provides early childhood development and parent support providers with a concise summary of evidence to support effective practice with infants and toddlers. Although much of the content is applicable to all ages, this information brief focuses on infants, meaning a child from birth to age three.

What is infant mental health?

When early childhood experts talk about the mental health of children under three, they are describing the infant's growing ability to experience, regulate and express emotions and to engage in loving relationships.ⁱⁱ All aspects of a child's development are affected by his or her emotional health because young children who are mentally healthy are free to learn and explore the environment around them. Thus the infant's cognitive and motor development, among other skills, are closely tied to the child's emotional well-being. Development is interconnected; the infant who can't rely on a consistent person to provide a soothing response when he or she is distressed, ill, hurt or lonely, can't develop properly. When the relationship between an infant and caregiver is not going well, it is harder for the infant to reach his or her full potential.ⁱⁱⁱ

What do infants need for healthy emotional development?

Infancy is a period of exuberant growth and change. The newborn brain is approximately one quarter to one third the weight of an adult brain. A significant portion of brain growth happens before the second or third birthday. While humans are born with the majority of brain cells (called neurons) present, the connections between brain cells (called synapses) that are rapidly created during this period, allowing learning and thinking to take place. Think of the wiring in a house that is necessary before electricity can flow as the 'brain architecture' that is developing.^{iv}

The active ingredient in this process is the give and take of daily social interactions with important people in the infant's life, such as parents, childcare providers, or other familiar people. Think of the 'serve and return' of a game of tennis – the infant smiles and coos, the parent responds. These interactions sculpt the developing brain by strengthening connections that are repeatedly used while unused connections are lost or replaced. In other words, the brain is sculpted on the principle of 'use it or lose it'. Emotional well being along with cognitive and language skills are based on this continuous, everyday give and take that occurs between children and parents. In order to develop properly, all children, even very young infants, need at least one continuous and caring relationship with an adult who will respond to their distress, provide them with opportunities for positive social interactions, and support them to explore their environment.^v

How do infants develop mental health problems?

It is rare that a single event, even a traumatic one, will profoundly alter the emotional well being of an infant if the child has caring adults to turn to for comfort and support. More often it is the accumulation of risk factors or repeated exposure to traumatic events, combined with an absence of emotionally nurturing care, that impedes development.^{vi}

Risk factors could include:

- child vulnerabilities such as prenatal exposure to alcohol or drugs, congenital problems or sensitive temperament
- parent risk factors such as mental illness, addictions, low cognition or poor understanding of development
- multiple adversities such as poverty, insecure housing, social isolation or family violence
- parent-child relationship issues such as attachment problems

Traumatic events for an infant could include:

- exposure to frightening caregiver behaviour
- multiple changes in caregivers
- chronic emotional deprivation

Chronic neglect, especially emotional deprivation, deprives infants and toddlers of the interpersonal experiences they need to develop language and social skills, and exposes them to chronic stress. When babies experience too much stress during sensitive periods of development the development of the brain can be affected and important social skills are impaired.^{vii}

Babies and toddlers who are repeatedly frightened by their parents, because of threatening behaviour or exposure to family violence, are also at very high risk of serious emotional problems and developmental impairments that might not be apparent for several more years. Even children who are too young to form a conscious memory of traumatic events can be affected later on.^{viii}

Research has clearly demonstrated a direct relationship between the numbers of moves a foster child makes and negative outcomes such as attachment and behaviour problems, further placement breakdowns, and mental health problems. Infants and toddlers are capable of powerful emotions such as love, joy, grief and fear. When very young children are placed with temporary caregivers for extended periods or experience even one or two placement disruptions, their physical and emotional health can be permanently affected.^{ix, x}

What are the symptoms of emotional problems in children under three?

Once infants settle into a routine (usually sometime in the first few months) they generally become more predictable and easier to 'read' – that is, they develop a predictable sleep/wake cycle and can generally give accurate cues to help their caregiver understand and respond to their needs. Even typically developing babies can go through difficult phases (For more information see www.purplecrying.info) but the caregiver can still recognize and respond to their distress. When the relationship between an infant and caregiver isn't going well, however, the infant can develop symptoms that are early warning signs of emotional distress or emerging mental health concerns. Because early childhood development and family support providers are often the first point of contact with families of infants, it is important to recognize these symptoms and know how to respond.

Each symptom listed below can have a variety of causes, for example children with specific health problems may have feeding and digestion problems, and children who have spent long periods in hospitals may be irritable and make poor eye contact. Seek guidance from a public health nurse or other health care or mental health professional if any concerns arise. Public health nurses in British Columbia can screen for social and emotional concerns and help with appropriate referrals.^{xi}

Health concerns - Chronic health problems or developmental delays; sudden unexplained regression in skills; feeding and/or digestion problems; odd eating habits; poor muscle tone or rigid, stiff muscles.

Social Lack of eye contact; infrequent social smiles and lack of shared social interest (pointing or gesturing at things); in older toddlers, lack of empathy and/or fearlessness; unusually fearful of or overly friendly with strangers.

Behaviour Failure to establish sleep/wake cycle; Repetitive or compulsive behaviours; odd or primitive self-soothing behaviour (e.g. rocking, head banging, chewing non-food items, picking at hair or skin); unusual aggressiveness with siblings, peers or family pets.

Mood Recurrent fretfulness or irritability that can't be explained by illness or 'colic' (see www.purplecrying.info for more information); no interest in play or little make-believe play by age three; little interest in others.

Sensitivity Easily upset or unusually upset by changes in routine or people; hyper-vigilant (wide-eyed, stiff muscle tone, wary); fearful; unusually sensitive to touch, light or noise; frequent nightmares.

2 *What should I do if I am concerned about a parent and infant?*

If the symptoms or concerns are very serious or if mistreatment is suspected, contact local child protection authorities immediately (For contact information see page 5). For most families building a trusting and supportive relationship with parents is fundamental to changing the way they interact with their children. For this reason the expression of empathy toward a parent in distress, offering practical help with problems and being a knowledgeable resource for parenting advice or referral information are important first steps. Early childhood development and family support providers can offer practical ideas that will help parents build a healthy relationship with their offspring.

The next section offers practical tips for all parents along with community referral suggestions for assessment or intervention when problems arise.

Building healthy parent/infant relationships^{xii}

Help parents understand that their primary job is to form a close emotional tie with their infant by being a reliable source of comfort to their infant, keeping the infant safe, and supporting his or her exploration of the world. Refer to this primary theme when concrete situations create 'teachable moments'.

Use everyday informal interactions to help parents learn about typical infant development and help them establish reasonable expectations for their child from infancy.

Encourage parents to hold their infant and help them position the infant for maximum face-to-face contact; infants need physical soothing, affectionate touch and playful physical interactions that are matched to their abilities.

Help parents to read their infant's cues and respond to their infant's lead. Some cues that can be pointed out to parents are:

- *I need a rest cues* (turning away, loss of eye contact)
- *Distress cues* (hiccupping, frowning, crying, pulling away)
- *I like that!* (smiling, giggling, gazing, reaching, cooing)
- *I need you* (reaching for parent, following parent, distressed facial expression such as trembling lip)

Slow down intrusive parents by encouraging them to watch and wait before they respond. Support passive parents by speaking for the infant (example, saying: "I love it when you hold me like that mommy" etc.). Early childhood development and family support providers can encourage parents to give a soothing response with concrete ideas such as swaddling, rocking, using a soft voice, and so on. Be confident in telling parents that they cannot spoil their infant. In fact, research is clearly showing that more responsive parents have infants who cry less frequently than parents who ignore their infant's distress.^{xiii}

The parent is the 'best toy in the room.' Encourage parents to get face-to-face on the floor with their infant. This not only encourages motor skills, it teaches parents how to play with their infant.

Help parents label emotions and talk out loud about feelings. Parents can learn to give an empathetic response to difficult feelings with coaching. Even when parents have to curtail problem behaviour in children they can learn to do so with empathy. When children learn to express their feelings and are confident of a soothing response, they have less need to act out behaviourally.

Nobody is perfect. Perfection in parenting is impossible to achieve and isn't even recommended.

Gentle hands/kind voice: At the heart of a healthy parent-child relationship is trust and confidence that the parent will be a reliable source of comfort and will help the child feel safe and secure.

3 *Where can I find local resources to help?*

Services for infants and families:

- Health professionals including: family physicians, pediatricians, psychiatrists, public health nurses, speech and language therapists, occupational therapists, physiotherapists and social workers
- Early Intervention Programs: www.mcf.gov.bc.ca/spec_needs/eits.htm
- BC Children's Infant Psychiatry Clinic: phone 604 875-2010 or www.bcchildrens.ca
- Child & Youth Mental Health Services (Ministry of Child and Family Development or MCFD): http://www.mcf.gov.bc.ca/mental_health/pdf/office_services.pdf.
- MCFD Child Welfare Worker: local MCFD office is listed in the blue pages of the phone book; after hours, phone the Helpline for Children at 310-1234 (no area code is needed) or visit www.mcf.gov.bc.ca/getting_help/help.htm.
- Infant Development Programs: www.mcf.gov.bc.ca/spec_needs/idp/htm
- Aboriginal Infant Development Programs: www.mcf.gov.bc.ca/spec_needs/aidp.htm
- HealthLink BC: Dial 811 or visit www.healthlinkbc.ca

Services for adults:

- Crisis Line Association of BC's Mental Health Support and Information Calls: 310-6789 (no area code needed) or www.crisislines.bc.ca
- The Crisis Centre: 1-800-SUICIDE (784-2433) or www.crisiscentre.bc.ca
- Alcohol and Drug Information and Referral Service: 1-800-663-1141 or (604) 660-9382 (Lower Mainland)
- Pacific Postpartum Support Society: (604) 255-7999 or www.postpartum.org
- BC Reproductive Mental Health Program: www.bcwomens.ca/Services/HealthServices/ReproductiveMentalHealth/default.htm

Check your local Health Authority for other services for infants, families and adults:

- Interior Health Authority: <http://www.interiorhealth.ca>
- Fraser Health Authority: <http://www.fraserhealth.ca>
- Vancouver Coastal Health Authority: <http://www.vch.ca>
- Vancouver Island Health Authority: <http://www.viha.ca>
- Northern Health Authority: <http://www.northernhealth.ca>
- Provincial Health Services Authority: <http://www.phsa.ca/default.htm>
